QUESTION NO: 1

A client must create and maintain multi-lingual sites. The system must support and deliver 20,000 transactions per day and support six languages. The client wants to automate this process so that the sites can be translated easily without too much human intervention.

Which two benefits does AEM provide to help the client maintain multi-lingual sites? (Choose two.)

- A. AEM's Translation Integration framework works only with the Microsoft Translator.
- B. AEM's Translation Integration framework can be extended with a custom connector.
- C. AEM ships with its own translation service out-the-box that can be used in conjunction with workflows for translations.
- D. AEM provides connectors to a variety of translation vendors.

ANSWER: A C

QUESTION NO: 2

A client wants to develop a set of Adaptive Forms in AEM Forms 6.3 environment. Each adaptive form will have an XSD attached. Some forms will share a common schema. Other forms will have their own unique schemas attached to them. The client wants to create a data dictionary and then start forms development.

What should be done to ensure the success of this approach?

- A. Users should implement a fragment within the form and use that for a visual representation to show to users.
- B. Mockups should be completed with the data dictionary to give the client functional and visual representation of the form.
- C. By using a flowchart users can see what the flow of the form would be for users entering form data.
- D. Typically users go from data dictionary straight to form development and provide the client with a form.

ANSWER: A

QUESTION NO: 3

In a single workflow within an enterprise's environment, the execute script component is being over-used.

There are six instances of the execute script. All instances contain the same code. On average, this workflow is executed 400 times a business week. The workflow does not include any custom components. It reads from the file system and then runs execute script components along the lifetime of the workflow.

Which two approaches will improve code maintainability within the workflow? (Choose two.)

- A. Create a sub-process using foundation components.
- B. Create a sub-process with the execute script.
- C. Create an SCV project.
- D. Create a custom component.

ANSWER: A C

QUESTION NO: 4

Refer to the exhibit.

What is the purpose of the third party data store?

- A. Storing customer data collected from company applications that trigger AEM Watched Folders and kicking off batch processes to print PDF invoices
- B. Centralized location for storing Watched Folder results and failures to provide business users the ability to analyze results without IT assistance
- C. Providing transactional backups of the Watched Folder results and failures and providing real-time restoration points to process clustered environments
- D. Storing forms authored by developers located in centralized or distributed environments and approval workflows prior to producing printed product

ANSWER: B

QUESTION NO: 5

Company LMC is launching a forms portal to support e-commerce across multiple countries supporting multiple languages. High-level requirements are outlined by the client.

- 25 countries
- 5 languages
- 10,000 AEM site pages
- Geographically distributed development teams
- Java and .net is used by the company
- DevOps is very mature within the company

An AEM developer wants to proceed with setting up the ability to support multiple languages. What best practice should be taken as a first step in setting up the environment?

- A. Create an '/apps/myProject/i18n' folder for the project
- B. Use the AEM Translator tool to update '/libs/granite/i18n' when editing localization data
- C. Ensure ACLs allow the AEM translation bundle to interact with '/libs/granite/i18n'
- D. Create a '/libs/myProject/i18n' folder for the project

ANSWER: C

QUESTION NO: 6

A client is setting up a cluster of eight nodes split across two cabinets in the same datacenter. Each cabinet is on a separate subnet and has separate backup power. The client requires maximum uptime.

What cluster caching mechanism should be recommended?

- A. UDP discovery, which is ideal for working across subnets,
- B. TCP locators, at least one on each cabinet.
- C. TCP locators, one on each node.
- D. Use both TCP and UDP locators for maximum uptime.

ANSWER: A

QUESTION NO: 7

A client has a set of four publish servers. All publish servers host forms. The client has configured all publisher servers to communicate to their back end JEE processing cluster. After performing a penetration test the security team is able to capture the outgoing XML data to a workflow.

What should the AEM forms architect recommend to protect against this?

- A. Enable SSL on your processing cluster to encrypt the traffic.
- B. Enable SSL on the Adobe LiveCycle Client SDK Configuration.
- C. Enable SSL on the AEM server to encrypt all traffic
- D. Enable SSL on your processing cluster and configure the Adobe LiveCycle Client SDK.

ANSWER: B
