## QUESTION NO: 8

```
1 {
2   'data':
3     [
4       {
5         'count':4,
6         'detailsURL': '',
7         'name': 'vEdge Hardware Health',
8         'status': 'error',
9         'statusList':
10        [
11          {
12            'count':4
13            'detailsURL': '/dataservice/device/hardwarehealth/detail?state=normal',
14            'message': '4 (normal=4, warning=0,error=0)',
15            'name': 'normal',
16            'status': 'up'
17          }
18        ]
19      }
20    ]
21 }
```

Refer to the exhibit. Cisco SD-WAN deployment must be fixed using vManage APIs. A call to vEdge Hardware Health API returns the data in the exhibit (only a portion is shown). If the JSON shown in the exhibit is converted to a Python dictionary named “d”, how is the “status” property referenced?

- A. d['data']['statusList']['status']
- B. nbvnbvvnbhg
- C. d{'data'}[0]['statusList'][0]['status']
