QUESTION NO: 1

A large Internet company has services running on physical machines, as well as self-built monitoring and alert system. Recently, the company wants to migrate part of the services to

Alibaba Cloud and use CloudMonitor to monitor ECS instances and set alerts.

What should the company do to quickly interconnect CloudMonitor alerts with the self-built alert system, and handle both alerts (alerts about the physical machines and ECS instances) in self-built alert system?

- A. Use the Event Monitoring function provided by CloudMonitor to consume alerts sent from self-built alert system
- B. Call the API for querying data provided by CloudMonitor. regularly query data, and write a code to check whether indicators are abnormal
- C. Call the API for obtaining messages and alerts that are sent to self-build alert system
- D. This cannot be implemented.

ANSWER: B

QUESTION NO: 2

A website is built using open-source software. To prevent hacker attacks and fix vulnerabilities in a timely manner, the administrator of the website wants to use the patch management feature in Security Center. Which of the following statements about patch management is FALSE.

- A. Before patches for most common Web vulnerabilities are released, the Alibaba Cloud Security O&M team will have fixed the vulnerabilities using self-developed patches
- B. Rollback of Web vulnerabilities means to restore the original files, while rollback of Windows vulnerabilities means to uninstall the patch upgrade
- C. Patch management can operate machines in batches in the cloud. For large-scale vulnerabilities, it supports one-key patch upgrade, which is easy and convenient
- D. Vulnerabilities are automatically fixed. Once a self-developed patch is released, it automatically fixes vulnerabilities for all customers who have enabled patch management.

ANSWER: D
