QUESTION NO: 8

The _____ pattern is applied to establish a _____ system that can address failure conditions that occur at runtime. This system can monitor and respond to a range of failure conditions.

- A. Dynamic Data Normalization, usage monitoring
- B. Service Load Balancing, load balancing
- C. Synchronized Operating State, failover
- D. Dynamic Failure Detection and Recovery, resilient watchdog

ANSWER: D

QUESTION NO: 9

The following statements describe how the automated scaling listener mechanism can be used as part of the system that is established by the application of the Elastic Resource Capacity pattern.

Which of these statements are false? (Choose Two)

- A. The automated scaling listener notifies the intelligent automation engine to execute a script that instructs the hypervisor to allocate additional resources.
- B. The automated scaling listener assigns additional CPUs to the virtual server, based on the workload processing requirements.
- C. The automated scaling listener monitors message traffic between cloud service consumers and the cloud services being hosted by the virtual server to which the pattern has been applied.
- D. The automated scaling listener withdraws previously assigned CPUs when they are no longer needed and returns them to the shared resource pool.

ANSWER: B D
