QUESTION NO: 1

A business owner requests that a detector be disabled because it has identified sensitive information in an approved repository. The security administrator verifies that the data is legitimately required, but the findings show that access is broader than the owner expected. What is the best response?

A. Disable the detector because the repository is approved.

B. Delete all data from the repository without reviewing the business requirement.

C. Keep the detector enabled and remediate the unnecessary access to the approved repository.

D. Remove the compliance tag so that the findings are no longer prioritized.

ANSWER: C

Explanation:

Keep the detector enabled and remediate the unnecessary access to the approved repository. is correct because the detector is correctly providing visibility into sensitive data and its exposure. Approved storage does not make overly broad access acceptable. The appropriate response is to preserve discovery and address the risk condition.

Disabling the detector removes visibility without resolving access. Deleting all approved data may be unnecessary and disruptive, while removing compliance context would reduce the ability to assess the applicable handling obligations.
